Although you may not own the expensive tooling and machining to perform all or any of the machining required for a quality build, you need to understand the principles, procedures, and goals for machining, so you can guide the machining process when outsourced. Classic and older engines typically require extensive machining and almost every major component of engine, including block, heads, intake, crankshaft, and pistons, require some sort of machining and fitment. A detailed, authoritative, and thorough automotive engine-machining guide hard-core engine builders and anyone interested in machining has not been available until now. Mike Magrivian, editor of Engine Building Professional, walks you through each important machining procedure. A stock 300-hp engine build has far different requirements than a 1,000-hp drag race engine, and Magrivian reveals the different machining procedures and plans according to application and engine design. The author also shows you how to inspect, measure, and evaluate components so you can purchase the astute gear and make the most work choices. Machining procedures included are cylinder boring, align boring/honing, deckung, valve seat cutting, cam tunnel boring, and a multitude of other services. In addition, multi-angle valve jobs, setting the valve seats, altering rocker arm ratio, re-conditioning connecting rods, and machining and matching valve train components are also covered. Whether you're an enthusiast engine builder or prospective machining student who wants to pursue a career as an automotive machinist, this book will provide insight and in-depth instruction for performing the most common and important machining procedures.**
