Behavioral Finance: The Second Generation Meir Statman 2019-12-02 Behavioral finance presented in this book is the second-generation of behavioral finance. The first generation, starting in the early 1980s, largely accepted standard finance’s notion of people’s wants as “rational” wants—restricted to the utilitarian benefits of high returns and low risk. That first generation commonly described people as “irrational”—succumbing to cognitive and emotional errors and misled on their way to their rational wants. The second generation describes people as normal. It begins by acknowledging the full range of people’s normal wants and their benefits—utilitarian, expressive, and emotional—distinguishes normal wants from errors, and offers guidance on using shortcuts and avoiding errors on the way to satisfying normal wants. People’s normal wants include financial security, nurturing children and families, gaining high social status, and staying true to values. People’s normal wants, even more than their cognitive and emotional shortcuts and errors, underlie answers to important questions of finance, including saving and spending, portfolio construction, asset pricing, and market efficiency.

PowerPC Microprocessor Common Hardware Reference Platform Apple Computer, Inc. 2012-06-25 This book defines the architecture requirements and minimum system requirements for a computer system that is designed to become an open industry standard. These requirements provide a description of the devices, interfaces, and data formats required to design and build a PowerPC-based computer. This standard is designed to provide software compatibility for several operating environments. Systems built to these requirements can use industry-standard components currently found in IBM-compatible and Apple® Macintosh® personal computers. These systems are expected to run various future versions of operating systems including Apple Mac OSTM, IBM AIXTM and PowerPCTM Editions of IBM OS/2 Warp ConnectTM, Microsoft Windows NTTM Workstation, Novell NetwareTM, and SunSoft SolarisTM. This book is the primary source of information for anyone developing a hardware platform, an operating system, or hardware component to be part of these standard systems. It describes the hardware-to-operating-system interface that is essential to anyone building hardware platforms and provides the minimum system configurations that platform designers must meet when building a standard platform. Component manufacturers require this information to produce compatible chips and adapters to use on these platforms, and software developers require the information on mandatory functions and documented interfaces. The architecture is intended to support a range of PowerPC microprocessor-based system implementations including portable, desktop, and server class systems, and allows multiple operating-system implementations across a wide range of environments and functions. This enables new hardware and software enhancements that are necessary for the development of improved user interfaces, higher performance, and broader operating environments.

The textbook examines a wide range of micro and macro topics, including prices and markets, equity versus efficiency, Rawls versus Bentham, accounting and the theory of the firm, optimal lot size and just in time, monopoly and competition, exchange rates and the balance of payments, inflation and unemployment, fiscal and monetary policy, IS-LM analysis, aggregate demand and supply, speculation and rational expectations, growth and development, exhaustible resources and over-fishing. While the content is similar to that of conventional introductory economics textbook, the assumption that the reader knows and enjoys the calculus distinguishes this book from the traditional text.

Avian Genetics F. Cooke 2013-09-24 Avian Genetics: A Population and Ecological Approach is a collection of papers that deals with the study of birds in relation to the synthetic theory of evolution. This book studies the ecology, demography, behavior, and geographical distribution of birds; the text also discusses quantitative, chromosomal, biochemical, and population genetics. Part I reviews the various genetic interactions, including an analysis of DNA sequence variation. The different and newer techniques are compared such as the works of Sibley, Quinn, and White. Part II describes the molding genetic variation and covers topics such as inbreeding; gene flow and the genetic structure of populations; non-random mating; and the process of selection in natural populations of birds. Part III covers actual genetic case histories, including quantitative ecological genetics of great tits; genetic evolution of house sparrows; and presentation of evidence for sexual selection by female choice in the Arctic Skua. This book also presents future research in subjects such as the neutrality-selection controversy or genetics and conservation. This text can be beneficial for ecologists, ornithologists, animal conservationists, and population biologists studying birds.
