**Building Design at Arup** Christian Schittich

2013

The idea of designing, planning and building as an inseparable process. The idea of "Total Architecture", as described by Ove Arup in his vision of design, continues to serve as the maxim for the globally operating engineering firm ARUP and its Building Engineering Department. Drawing on selected projects from recent years, this second volume in the new DETAIL engineering series shows how future-oriented and sustainable civil engineering can be combined with this ideal of a holistic design process - always with the aim of achieving perfect unity of strength and elegance in every structure. The focus is placed on the different processes that have accompanied the presented construction projects. Connections are shown between the individual buildings whose synergies are pursued in an exemplary fashion. The remarkable building projects reveal what continues to drive and inspire the engineers at ARUP to this day: a passion for pioneering work. ARUP over the course of time. Process descriptions from the perspective of the involved architects, engineers and planners. From supporting structures to light design and building services to future-oriented civil engineering. Building Drawing  M. G. Shah 2012
Architectural Detailing  Edward Allen 2016-03-14
The industry-standard guide to designing well-performing buildings Architectural Detailing systematically describes the principles by which good architectural details are designed. Principles are explained in brief, and backed by extensive illustrations that show you how to design details that will not leak water or air, will control the flow of heat and
water vapor, will adjust to all kinds of movement, and will be easy to construct. This new third edition has been updated to conform to International Building Code 2012, and incorporates current knowledge about new material and construction technology. Sustainable design issues are integrated where relevant, and the discussion includes reviews of recent built works that extract underlying principles that can be the basis for new patterns or the alteration and addition to existing patterns. Regulatory topics are primarily focused on the US, but touch on other jurisdictions and geographic settings to give you a well-rounded perspective of the art and science of architectural detailing. In guiding a design from idea to reality, architects design a set of details that show how a structure will be put together. Good details are correct, complete, and provide accurate information to a wide variety of users. By demonstrating the use of detail patterns, this book teaches you how to design a building that will perform as well as you intend. Integrate appropriate detailing into your designs Learn the latest in materials, assemblies, and construction methods Incorporate sustainable design principles and current building codes Design buildings that perform well, age gracefully, and look great. Architects understand that aesthetics are only a small fraction of good design, and that stability and functionality require a deep understanding of how things come together. Architectural Detailing helps you bring it all together with a well fleshed-out design that communicates accurately at all levels of the construction process.

**Think Like an Architect** Hal Box 2010-01-01 An award-winning architect and educator demystifies the process of making architecture and explains why good architectural design matters. The design of cities and buildings affects the quality of our lives. Making the built environments in which we live, work, and play useful, safe, comfortable, efficient, and as beautiful as possible is a universal quest. What many don’t realize is that professional architects design only about five percent of the built environment. While much of what non-architects build is beautiful and useful, the ugliness and inconveniences that blight many urban areas demonstrate that an understanding of good architectural design is vital for creating livable buildings and public spaces. To help promote this understanding among non-architects and those considering architecture as a profession, award-winning architect and professor Hal Box explains the process from concept to completed building, using real-life examples to illustrate the principles involved. To cause what we build to become architecture, we have three choices: hire an architect, become an architect, or learn to think like an architect. In this book, organized as a series of letters to students and friends, Box covers: what architecture should be and do how to look at and appreciate good buildings how to understand the design process, work with an architect, or become an architect an overview of architectural history, with lists of books to read and buildings to see practical guidance about what goes into constructing a building an architect’s typical training and career path how architecture relates to the city where the art of architecture is headed why good architecture matters

**Protecting Building Occupants and Operations from Biological and Chemical Airborne Threats**
National Research Council 2007-08-10 Protecting buildings and their occupants from biological and chemical attacks to ensure continuous building operations is seen as an urgent need in the Department of Defense, given recent technological advances and the changing threats. Toward this end, the Department of Defense established the Immune Building Program to develop protective systems to deter biological and chemical attacks on military facilities and minimize the impacts of attacks should they occur. At the request of the Defense Threat Reduction Agency, the National Research Council convened a committee to provide guiding principles for protecting buildings from airborne biological or chemical threat agents and outline the variables and options to consider in designing building protection systems. This report addresses such components of building protection as building design and planning strategies; heating, ventilating, and air-conditioning systems; filtration; threat detection and identification technologies; and operational responses. It recommends that building protection systems be designed to accommodate changing building conditions, new technologies, and emerging
threats. Although the report's focus is on protection of military facilities, the guiding principles it offers are applicable to protection of public facilities as well.
