Madsen Emeritus 2011-11-21 This is the eBook of the printed book and may not include any media, website access codes, or print supplements that may come packaged with the bound book. Civil Drafting Technology Seventh Edition covers it all—basic and advanced topics—and everything in between, equipping readers to convert engineering sketches or instructions into actual formal drawings and gain a working knowledge of mapping. Using a “knowledge building” format where one concept is mastered before the next is introduced, Civil Drafting Technology includes: Basic Drafting Topics: Maps: fundamentals, types of maps, scales, symbols CAD: use, standards, applications Intermediate/Advanced Topics: Measuring distance and elevation, Surveying, Location & Direction, Legal Descriptions and Plot Plans, Contour Lines, Horizontal Alignment Layout, GIS: Career Development, Employment, Workplace Ethics, Professional Organizations CAD: Applications Content-related Tests: Real-world drafting and design problems

Drawing for Civil Engineering  Jan A. Van Der Westhuizen 2000 Commencing with the fundamentals of drafting and continuing with draughting practice and conventions, this textbook emphasizes detailing, rather than the calculations or design of the components.

Building Design at Arup  Christian Schittich 2013 The idea of designing, planning and building as an inseparable process The idea of ‘Total Architecture’, as described by Ove Arup in his vision of design, continues to serve as the maxim for the globally operating engineering firm ARUP and its Building Engineering Department. Drawing on selected projects from recent years, this second volume in the new DETAIL engineering series shows how future-oriented and sustainable civil engineering can be combined with this ideal of a holistic design process — always with the aim of achieving perfect unity of strength and elegance in every structure. The focus is placed on the different processes that have accompanied the development of these buildings. Connections are shown between the individual buildings whose synergies are pursued in an exemplary fashion. The remarkable building projects reveal what continues to drive and inspire the engineers at ARUP.

Think Like an Architect  Hal Box 2010-01-01 An award-winning architect and educator demystifies the process of making architecture and explains why good architectural design matters. The design of cities and buildings affects the quality of our lives. Making the built environments in which we live, work, and play useful, safe, comfortable, efficient, and as beautiful as possible is a universal quest. What many don’t realize is that professional architects design only about five percent of the built environment. While much of what non-architects build is beautiful and useful, the ugliness and inconveniences that blight many urban areas demonstrate that an understanding of good architectural design is vital for creating livable buildings and public spaces. To help promote this understanding among non-architects and those considering architecture as a profession, award-winning architect and professor Hal Box explains the process from concept to completed building, using real-life examples to illustrate the principles involved. To cause what we build to become architecture, we have three choices: hire an architect, become an architect, or learn to think like an architect. In this book, organized as a series of letters to students and friends, Box covers: what architecture should be and how to look at and appreciate good buildings how to understand the design process, work with an architect, or become an architect an overview of architectural history, with lists of books to read and buildings to see practical guidance about what goes into constructing a building an architect’s typical training and career path how architecture relates to the city where the art of architecture is headed why good architecture matters Protecting Building Occupants and Operations from Biological and Chemical Airborne Threats  National Research Council 2007-08-10 Protecting buildings and their occupants from biological and chemical attacks to ensure continuous building operations is seen as an urgent need in the Department of Defense, given recent technological advances in the weapons development. Toward this end, the Department of Defense established the Immune Building Program to develop protective systems to deter biological and chemical attacks on military facilities and minimize the impacts of attacks should they occur. At the request of the Defense Threat Reduction Agency, the National Research Council convened a committee to provide guiding principles for protecting buildings from airborne biological or chemical threat agents and outline the variables and options to consider in designing building protection systems. This report addresses such components of building protection as building design and planning strategies; heating, ventilating, and air-conditioning systems; filtration; threat detection and identification technologies; and operational responses. It recommends that building protection systems be designed to accommodate changing building conditions, new technologies, and emerging threats. Although the report’s focus is on protection of military facilities, the guiding principles it offers are applicable to protection of public facilities as well.
