Nutrition and Neurodisability Peter Sullivan 2020-02-25 This handbook provides easily accessible information on the aetiology, assessment and management of nutritional disorders in children with neurodisability. Succinct review of current evidence and guidelines is used to inform best practice. Early chapters outline the normal anatomy and physiology of feeding before considering the aetiology and management of disordered feeding, and impact on nutritional status. Subsequent chapters discuss nutritional assessment and management supported by clear illustration of anthropometry techniques. Further consideration of the consequences of under and over nutrition, and impact on bone health is included. Dedicated chapters on associated gastrostomal problems, management of drooling and dental care consider related comorbidities commonly experienced by children with neurodisability. A dedicated chapter on the use of tube feeding considers specific nutritional requirements and psychological aspects of intervention. Clinical vignettes are used to illustrate key learning points throughout.

Guidelines for the Use of Parenteral and Enteral Nutrition in Adult and Pediatric Patients 1999

Institute of Medicine 2000-06-05 Malnutrition and obesity are both common among Americans over age 65. There are also a host of other medical conditions from which older people and other Medicare beneficiaries suffer that could be improved with appropriate nutritional intervention. Despite that, access to a nutrition professional is very limited. Do nutrition services benefit older people in terms of morbidity, mortality, or quality of life? Which health professionals are best qualified to provide such services? What would be the cost to Medicare of such services? Would the cost be offset by reduced illness in this population? This book addresses these questions, provides recommendations for nutrition services for the elderly, and considers how the coverage policy should be approached and practiced. The book discusses the role of nutrition therapy in the management of a number of diseases. It also examines what the elderly receive in the way of nutrition services along the continuum of care settings and addresses the areas of expertise needed by health professionals to provide appropriate nutrition services and therapy.

Intravenous Lipid Emulsions P.C. Caller 2014-11-26 Lipids have been in clinical use as components of intravenous nutrition for over 50 years. Over the last 15 years, new and improved lipids that include oleic acid and/or fish oil have replaced the more traditional ones. These new lipids offer the opportunity to deliver high amounts of fatty acids and possess different functional properties in particular, they can influence inflammatory processes, immune responses and hepatic metabolism. This book brings together articles written by leading international authorities in the area of intravenous lipids. Contributions discuss the latest findings in the field, ranging from pre-clinical research to the most recent clinical trials. Lipid functionality and utility in pediatric, adult surgical and critically ill patients are covered, as is the use of lipids in long-term home parenteral nutrition. Addressing a broad spectrum of topics, this publication provides a wealth of information for basic scientists, clinical researchers and clinical practitioners alike.
