International Competitiveness in Financial Services Marvin H. Kusters 2012-12-06 financial markets suggests that factors such as differences in capital requirements, limitations on size or on the range of financial activities in which firms can engage, government guarantee arrangements for deposits or payments, and reporting or disclosure requirements can have important effects on the efficiency of industrial and commercial firms and thus on the international competitive positions of major sectors of the U.S. economy. Regulatory and tax policies must therefore take into account effects on international competitive positions in addition to domestic concerns. The articles in this issue analyze differences in market organization and regulation across countries and examine how efficiency in producing financial services is influenced by these differences. These articles were presented and discussed at a conference sponsored by the American Enterprise Institute in Washington, D.C., on May 31 and June 1, 1990. This conference on International Competitiveness in Financial Services brought to the attention of Washington policy officials these analyses by leading scholars in finance. Publication of these studies and critiques in the Journal of Financial Services Research is intended to stimulate further interest in research on these important issues.

Accounting for Value Stephen Penman 2010-12-30 Accounting for Value teaches investors and analysts how to handle accounting in evaluating equity investments. The book's novel approach shows that valuation and accounting are much the same: valuation is actually a matter of accounting for value. Laying aside many of the tools of modern finance the cost-of-capital, the CAPM, and discounted cash flow analysis Stephen Penman returns to the common-sense principles that have long guided fundamental investing: price is what you pay but value is what you get; the risk in investing is the risk of paying too much; anchor on what you know rather than speculation; and beware of paying too much for speculative growth. Penman puts these ideas in touch with the quantification supplied by accounting, producing practical tools for the intelligent investor. Accounting for value provides protection from paying too much for a stock and clues the investor in to the likely return from buying growth. Strikingly, the analysis finesses the need to calculate a "cost-of-capital," which often frustrates the application of modern valuation techniques. Accounting for value recasts "value" versus "growth" investing and explains such curiosities as why earnings-to-price and book-to-price ratios predict stock returns. By the end of the book, Penman has the intelligent investor thinking like an intelligent accountant, better equipped to handle the bubbles and crashes of our time. For accounting regulators, Penman also prescribes a formula for intelligent accounting reform, engaging with such controversial issues as fair value accounting.

Logistics management operationalised in a healthcare context Malin Wiger 2018-05-14 Healthcare improvements is constantly relevant and an important topic. Healthcare is frequently being called upon to be more cost-efficient and still fulfil demands regarding waiting times, quality and availability. Experience from structural changes in other contexts gives reason to be positive about the potential for logistics improvements in the healthcare sector as well. From a logistics perspective patients pass different care functions, units, organisations and health facilities. It is assumed that logistics management knowledge applied in healthcare can lead to lower costs, shorter waiting times, better patient service, shorter treatment times and increased capacity. This dissertation therefore presents an exploration of how logistics management theories can be operationalised in a healthcare context to understand care chain effectiveness. Theoretically, the operationalisation is done by systems theory creating compatibility between logistics management theories and the healthcare context. As a first step, features for a logistics system forms features for achieving care chain effectiveness. High care chain effectiveness is thus a desired condition and the care delivery system is the tool to achieve it. As the final step in the operationalisation the features for care chain effectiveness are in turn used to analyse today's practices. Empirically, the research is based on qualitative data from a single case study with multiple units of analysis. It includes four care units at one of Sweden's university hospitals, where the data is gathered through interviews, insight into management systems and document analysis. One of the main results is the 21 areas identified for analysing today's practices by means of features for care chain effectiveness. Another main result is the four important concepts revealed through the operationalisation: Lead time - the episode of care from order to delivery as the amount of time for patient cases between first

contact with healthcare and the last. Patient order fulfilment - fulfilment of patients' needs, broken down into several smaller steps performed over time within different care units in one or several organisations, consisting of five sub-processes - order handling, diagnosis, treatment, follow-up, and discharge. True demand - patients' needs that is to be met and thus sets what care to deliver, i.e. the production plan and the subordinate resource plan. System boundaries - defines which care units to include when focusing on the care delivery system's performance as a whole and should be more important than the performance and productivity of each individual care unit. A number of direct suggestions for care chain improvement can also be found in the concluding remarks, for example that objectives linked to economic influx or penalty narrow the system and that lead time data on an aggregated level is needed to cover episodes of care. The theoretical contribution of the dissertation is to the field of logistics management through the methodological development of using these theories in a new context. The managerial contribution is to healthcare managers through providing opportunities to improve care chains primarily by means of a greater understanding of care delivery systems.

Food, Energy, and Water Nexus Chittaranjan Ray 2022-01-17 In this book, major issues surrounding importance of water and energy for food security in the United States and India are described representing two extremes in yield, irrigation efficiency, and automation. The farming systems in these two countries face different risks in terms of climatic shifts and systems' resiliency to handle the shocks. One may have comparative advantage over the other, but both are susceptible. Innovations in irrigation for food and fuel production, improvements in nitrogen and water use efficiency, and rural sociological issues are discussed here. We also look into some of the unintended consequences of high productivity agriculture in terms of surface and ground water quality and impacts on ecosystem services. Finally, we present ways to move forward to meet the food demands in the next half-century in both countries. As the current world population of 7 billion is expected to reach or exceed 10 billion in the next 40 years, there will be significant additional demand for food. A rising middle class and its preference for a meat-based diet also increases the demand for animal feed. This additional food and feed production needs special considerations in water and energy management besides the development of appropriate crop hybrids to withstand future climatic shifts and other environmental factors. A resilient agricultural landscapes will also be needed to withstand climatic fluctuations, disease pressures, etc. While the upper and many middle income countries have made significant improvements in crop yield due to pressurized irrigation and automation in farming systems, the lower income countries are struggling with yield enhancements due to such limitations. The rise in population is expected to be more in Sub-Saharan Africa and Middle East (Low to middle-income countries) where the crop yields are expected to be low.

Sustainable Growth and Development of Economic Systems Svetlana Ashmarina

2019-03-15 This contributed volume presents the outcomes of multidisciplinary studies on the problem of sustainable economic development. The key issues addressed here are economic transformation, crisis management, formation and implementation of industrial policy in the innovative economy, and the development of individual industries (oil refining, transport, education, tourism, the financial sector, etc.), as well as the problem of resistance to changes in the economy. In turn, the second part is devoted to an analysis of the innovative development of the economy, risk assessment for innovation projects, readiness for changes and innovations, and various instruments of innovative economic development. Prospects for the digitalization of the economy and the current changes in economic systems caused by digitalization are considered in the third part of the book. In the fourth part, the authors discuss the specific features of labor market development, and professional competencies that will be essential to the sustainable development of the economy. Systems of Insight for Digital Transformation: Using IBM Operational Decision Manager Advanced and Predictive Analytics Whei-Jen Chen 2015-12-03 Systems of record (SORs) are engines that generates value for your business. Systems of engagement (SOE) are always evolving and generating new customer-centric experiences and new opportunities to capitalize on the value in the systems of record. The highest value is gained when systems of record and systems of engagement are brought together to deliver insight. Systems of insight (SOI) monitor and analyze what is going on with various behaviors in the systems of engagement and information being stored or transacted in the systems of record. SOIs seek new opportunities, risks, and operational behavior that needs to be reported or have action taken to optimize business outcomes. Systems of insight are at the core of the Digital Experience, which tries to derive insights from the enormous amount of data generated by automated processes and customer interactions. Systems of Insight can also provide the ability to apply analytics and rules to real-time data as it flows within, throughout, and beyond the enterprise (applications, databases, mobile, social, Internet of Things) to gain the wanted insight. Deriving this insight is a key step toward being able to make the best decisions and take the most appropriate actions. Examples of such actions are to improve the number of satisfied clients, identify clients at risk of leaving and incentivize them to stay loyal, identify patterns of risk or fraudulent behavior and take action to minimize it as early as possible, and detect patterns of behavior in operational systems and transportation that lead to failures, delays, and maintenance and take early action to minimize risks and costs. IBM® Operational Decision Manager is a decision management platform that provides capabilities that support both event-driven insight patterns, and business-rule-driven scenarios. It also can easily be used in combination with other IBM Analytics solutions, as the detailed examples will show. IBM Operational Decision Manager Advanced, along with complementary IBM software offerings that also provide capability for systems of insight, provides a way to deliver the greatest value to your customers and your business. IBM Operational Decision Manager Advanced brings together data from different sources to recognize meaningful trends and patterns. It empowers business users to define, manage, and automate repeatable operational decisions. As a result, organizations can create and shape customer-centric business moments. This IBM Redbooks® publication explains the key concepts of systems of insight and how to implement a system of insight solution with examples. It is intended for IT architects and professionals who are responsible for implementing a systems of insights solution requiring event-based context pattern detection and deterministic decision services to enhance other analytics solution components with IBM Operational Decision Manager Advanced.

Investing with the Trend Gregory L. Morris 2013-12-31 Investing with the Trend provides an abundance of evidence for adapting a rules-based approach to investing by offering something most avoid, and that is to answer the "why" one would do it this way. It explains the need to try to participate in the good markets and avoid the bad markets, with cash being considered an asset class. The book is in three primary sections and tries to leave no stone unturned in offering almost 40 years of experience in the markets. Part I - The focus is on much of the misinformation in modern finance, the inappropriate use of Gaussian statistics, the faulty assumptions with Modern Portfolio Theory, and a host of other examples. The author attempts to explain each and offer justification for his often strong opinions. Part II - After a lead chapter on the merits of technical analysis, the author offers detailed research into trend analysis, showing how to identify if a market is trending or not and how to measure it. Further research involves the concept of Drawdown, which the author adamantly states is a better measure of investor risk than the oft used and terribly wrong use of volatility as determined by standard deviation. Part III - This is where he puts it all together and shows the reader all of the steps and details on how to create a rules-based trend following investment strategy. A solid disciplined strategy consists of three parts, a measure of what the market is actually doing, a set of rules and guidelines to tell you how to invest based upon that measurement, and the discipline to follow the strategy
