The U.S. Navy is ready to execute the Navy's task at sea, from prompt and sustained combat operations to every-day forward presence. Diplomacy and relief efforts. We operate worldwide, in space, cybersecurity, and throughout the nautical domain. The United States is and will remain a maritime nation, and our security and prosperity are inseparably linked to our ability to operate across the seas and oceans of the world. To that end, the Navy executes programs that enable our Sailors, Marines, civilians, and forces to meet existing and emerging challenges at one with effectiveness.

This book provides a comprehensive coverage of the various aspects of glass science from the leading experts in the field. Opening with an enlightening contribution on the history of glass, the volume then delves into eight parts. The first part covers fundamental properties, from the current understanding of the thermodynamics of the amorphous state, kinetics, and inelastic and nonlinear optical properties through color, photoelasticity, and chemical durability. The second part presents dedicated chapters on each individual glass type, covering traditional systems like silicates and oxide glasses, as well as novel hybrid amorphous materials and glass fibers. The third part features detailed descriptions of modern characterization techniques for understanding this complex state of matter. The fourth part covers modeling, first-principles calculations through molecular dynamics simulations, and statistical modeling. The fifth part presents a range of laboratory and industrial glass processing methods. The remaining papers cover a wide range of highly important areas such as optics and photonics through electronic, magnetic, and optical properties, and in general that is not possible to achieve.
