Automotive Machining Mike Mavrigian 2017-04-17 Machining is an essential part of high-
performance engine building and stock rebuilding, as well as certain servicing procedures.
Although you may not own the expensive tooling and machining to perform all or any of
the machining required for a quality build, you need to understand the principles, procedures, and
goals for machining, so you can guide the machining process when outsourced. Classic and older
engines typically require extensive machining and almost every major component of engine,
including block, heads, intake, crankshaft, and pistons, require some sort of machining and
fitment. A detailed, authoritative, and thorough automotive-engine-machining guide for the hard-
core enthusiast has not been available until now. Mike Mavrigian, editor of Engine Building
Professional, walks you through each important machining procedure. A stock 300-hp engine
build has far different requirements than a 1,000-hp drag race engine, and Mavrigian reveals the
different machining procedures and plans according to application and engine design. The
author also shows you how to inspect, measure, and evaluate components so you can provide
autote instruction and make the best machine work choices. Machining procedures included are
cylinder boring, align boring/honing, deck, valve seat cutting, cam tunnel boring, and a
multitude of other services. In addition, multi-angle valve jobs, setting the valveset, altering
rocker arm ratio, re-conditioning connecting rods, and machining and matching valve train
components are also covered. Whether you're an enthusiastic engine builder or prospective
machining student who wants to pursue a career as an automotive machinist, this book will
provide insight and in-depth instruction for performing the most common and important
machining procedures.
