Boundaries and
RESPONSIBILITIES OF THE SURVEYOR. This completes the suggestions which I wished to offer, but I would like in conclusion to say a few words in a general manner. This very brief treatise is not intended as a handbook for surveyors in any way; it is not didactic -- it is suggestive only. It is intended to give a little light to men thrown, for perhaps the first time, on their own responsibility or brought face to face with problems which they have not met in their previous experience. For the solution of these problems no general rules can be laid down; each man must work out his own salvation. All that I hope to do is to give a few suggestions from hardwon personal knowledge which may make the road a little easier. The problems of boundary lie at the foundation of all surveying, for one must know where a line is before he can measure it, and the solution of these problems calls for the same powers of accurate observation and of consecutive and logical thought that are demanded for successful work in any branch of modern science. It is needless to say that the successful surveyor must be accurate in his instrument work and in his computation; yet, if he would really succeed, he must go beyond this. He must add to this the patience to collect all the evidence which can be found bearing upon the case in hand, together with the ability to weigh this evidence to a nicety and to determine clearly the course pointed out by the balance.
of probability. If, in addition, he possesses enough imagination to cast pleasant lights across the desert of dry details, he should be successful indeed. The watchwords of the surveyor are Patience and Common Sense. The vocation of the Civil Engineer has always been invested with a dignity of its own....

Surveying with the Tacheometer Neil Kennedy 1900

Surveying with the Tacheometer; a Practical
Surveyors establish official land, airspace, and water boundaries. They write descriptions of land for deeds, leases, and other legal documents; define airspace for airports; and take measurements of construction and mineral sites. Other surveyors provide data about the shape, contour, location, elevation, or dimension of land or land features. Cartographers and photogrammetrists collect, analyze, interpret, and map geographic information using data from surveys and photographs. Surveying and mapping technicians assist these professionals by collecting data in the field, making calculations, and helping with computer-aided drafting. Collectively, these occupations play key roles in the field of geospatial information. This book gives you good solid advice and great strategies for getting interviews and landing the job as Surveyor, Cartographer, Photogrammetrists, or Surveying and Mapping Technician. To Prepare for the Job this book tells you: - The training and education needed - Earnings - Expected job prospects -
The job's activities and responsibilities - Working conditions To Land the Job, it gives you the hands-on and how-to's insight on: - Finding Opportunities - the best places to find them - Writing Unbeatable Resumes and Cover Letters - Acing the Interview - What to Expect From Recruiters - How employers hunt for Job-hunters…. and More This book offers excellent, insightful advice for everyone from entry level to senior professionals. None of the other such career guides compare with this one. It stands out because it: 1. Explains how the people doing the hiring think, so that you can win them over on paper and then in your interview; 2. Is filled with useful cheat and work-sheets; 3. Explains every step of the job-hunting process - from little known ways for finding openings to getting ahead on the job. This book covers everything. Whether you are trying to get your first Job or move up in the system, get this book. **Surveying With the Tacheometer** Neil Kennedy 2008-10-01 This scarce antiquarian book is a facsimile reprint of the original.
